Transition to Stainless Steel Chassis for SlideDriver II

SUBJECT:

HySecurity is discontinuing galvanized covers and chassis for SlideDriver II, replacing them with 304 Stainless Steel for corrosion resistant operator configurations for no additional cost.

DATE: 07/2026

OPERATORS:

SlideDriver II

DESCRIPTION:

HySecurity is discontinuing the option for hot dip galvanized chassis and covers for all models of SlideDriver II, and will substitute 304 Stainless Steel chassis at no additional cost.

We are making this change to provide our customers exceptional quality, while reducing our environmental impact and improving lead times.

The stainless steel covers and chassis will be provided with a 2B mill finish or better. This finish is smooth and slightly glossy, with the presence of milky discolorations in places due to the rolling process used in the raw materials. There may also be areas where the surface was sanded to remove discoloration from welding. The cosmetic qualities will be generally better than the former galvanized finish.

HySecurity also offers stainless steel covers with a #4 brushed finish for additional charge. This process offers the highest level of appearance with outstanding corrosion resistance for a long lasting architectural finish.

EFFECTIVE DATE:

This change will become effective when current inventory of galvanized chassis and covers is exhausted.
